Soundness for Linear Logic regarding Phase Semantics

Ryo Haruyama

Nagoya Univ.

January 12, 2021

1/26

One kind of soundness for Linear Logic as to Phase Semantics is dealt with.

- What is Linear Logic?
- What is Phase Semantics?
- What is soundness?
- Proof of soundness
- Future work

What is Linear Logic?

Features:

- Decomposition of Classical Logic
- Realizing constructivity keeping Duality (symmetry) intact
- Resource sensitive (i.e. each hypothesize can be used exactly at once)
- Suitable for expressing parallel computing

Decomposition of Classical Logic

Familiar connectives "\" and "\" break into weaker four connectives:

- "∧" into "⊗" and "&"
- "∨" into "?" and "⊕"

Another viewpoint:

- Multiplicative are "⊗" and "?"
- Additive are "&" and "⊕"

System containing only Multiplicative and Additive is called MALL

Resource sensitiveness

" \multimap " is linear version of " \Rightarrow "

Usual logic:

$$\frac{X \quad X \Rightarrow Y}{Y \text{ (but } X \text{ still holds.)}}$$

Linear Logic:

$$\frac{X \quad X \multimap Y}{Y \text{ (and then } X \text{ disappears!)}}$$

5/26

$$\frac{f:A\multimap B \qquad g:C\multimap D}{f\otimes g:A\otimes B\multimap C\otimes D}$$

Meaning: Programs which do NOT share the same resouce can be executed at the same time.

& : Cartesian product

$$\frac{f: X \multimap Y \qquad g: X \multimap Z}{f \& g: X \multimap Y \& Z}$$

and

$$Y \& Z \nvdash Y \otimes Z$$

Meaning: Programs which share the same resource CANNOT be executed at the same time unless copying the resource, while we CAN CHOOSE either Y or Z.

In fact, copying and deleting of resources are explicit.

$$Y \oplus Z \nvdash Y$$

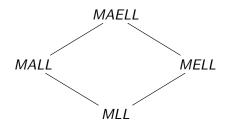

nor

$$Y \oplus Z \nvdash Z$$

Meaning : Either Y or Z holds, but we CANNOT choose neither Y or Z.

Off topic: Variants of Linear Logic

- Multiplicative are "⊗" and "?"
- Additive are "&" and "⊕"
- Exponential are "!" and "?"

What is Phase Semantics?

First off, what is semantics?

- To provide rigorous defnitions that abstract away from implementation details
- To provide mathematical tools for proving properties of programs (Amadio, Curien)

Phase Semantics is a kind of semantics, which is based on the idea of *Tarskian style*:

- "A" means A which is truth value (true or false)
- "A ∧ B" means "A" and "B"

and so on.

This seems ovious, however, there is another semantics which is not the case: *Coherent Semantics*, which is BHK style inconsistent semantics. *Phase Space* is Phase Semantics for MALL.

Other semantics

- Coherent semantics
- Categorical semantics
- Geometry of interaction
- Game semantics and so on.

What is *soundness*?

Formulae derived using specific rules are semantically valid, which is minimum requirement for semantics in general (Systems which yields lie are compeletely useless).

Syntax of MALL

Definition 1

Formula of MALL.

$$A ::= p \mid p^{\perp}$$

$$\mid A \otimes A \mid A \oplus A$$

$$\mid A \& A \mid A \Im A$$

$$\mid \mathbf{1} \mid \mathbf{0} \mid \top \mid \bot$$

Inference rules of MALL I

Inference rules of MALL.

$$\frac{ \vdash A, A^{\perp}}{\vdash A, A^{\perp}} \stackrel{(identity)}{\longleftarrow} \frac{\vdash \Gamma, A \vdash A^{\perp}, \Delta}{\vdash \Gamma, \Delta} (cut)$$

$$\frac{\vdash \Gamma, A, B, \Delta}{\vdash \Gamma, B, A, \Delta} (exchange)$$

$$\frac{\vdash \Gamma}{\vdash \Gamma} (one) \frac{\vdash \Gamma}{\vdash \Gamma \vdash} (false)$$

Inference rules of MALL II

$$\frac{\vdash \Gamma, A \vdash \Delta, B}{\vdash \Gamma, A \otimes B, \Delta} \text{ (times)} \qquad \frac{\vdash \Gamma, A, B}{\vdash \Gamma, A ? \!\!\!/ B} \text{ (par)}$$

$$\frac{\vdash \Gamma, A \vdash \Gamma, B}{\vdash \Gamma, A \otimes B} \text{ (with)} \qquad \frac{\vdash \Gamma, A}{\vdash \Gamma, A \oplus B} \text{ (left plus)}$$

$$\frac{\vdash \Gamma, B}{\vdash \Gamma, A \oplus B} \text{ (right plus)}$$

Phase Space

We give semantics for MALL.

Definition 2

Phase Space := (M, \perp)

where M is commutative monoid and $\bot \subseteq M$ is defined.

Definition 3

Commutative monoid M holds

- commutativity: pq = qp
- associativity: (pq)r = p(qr)
- identity: 1p = p1 = p

for all $p, q, r \in M$.

Definition 4

 $X \multimap Y$ is defined as

$$m \in X \multimap Y$$

: $\Leftrightarrow \forall x (x \in X \Rightarrow mx \in Y)$

Definition 5

orthogonal

$$X^{\perp} := X \multimap \perp$$

Definition 6

X is fact iff

$$X = X^{\perp \perp}$$

or equivalently, X is of the form Y^{\perp} .

Definition 7

For convention,

$$xy \in X.Y :\Leftrightarrow x \in X \land y \in Y$$

Let X and Y be fact. Connectives are interpreted in this way (more precisely, we are defining interpretation function from *formula* to $\wp(M)$):

$$X \otimes Y := (X.Y)^{\perp \perp}$$

$$X \otimes Y := (X^{\perp}.Y^{\perp})^{\perp}$$

$$X \longrightarrow Y = (X.Y^{\perp})^{\perp}$$

$$X & Y := X \cap Y$$

$$X \oplus Y := (X \cup Y)^{\perp \perp}$$

$$\mathbf{1} := \{1\}^{\perp \perp}$$

$$\mathbf{0} := \varnothing^{\perp \perp}$$

$$\top := M$$

Validity

Definition 8

Sequent

$$\vdash \Gamma, A$$

is interpreted as subset of M

$$\Gamma \Re A$$

Definition 9

 \underline{X} (as formula) is valid iff $1 \in \underline{X}$ ($\underline{X} \subseteq M$)

Proof of soundness I

Theorem 10

Sequent which are provable in MALL are all valid in Phase Space i. e.

$$\vdash \underline{X} \Rightarrow 1 \in \underline{X}$$

where X are all fact.

By straightforward induction on inference rules.

$$\frac{3}{\vdash A, A^{\perp}} (identity)$$

$$A \mathcal{P} A^{\perp} = A \multimap A \ni 1$$

(: definition of identity 1)

20/26

Proof of soundness II

$$\Gamma ? ? \top = \mathbf{0} \multimap \Gamma$$

Since $\mathbf{0}$ is the smallest fact, $\mathbf{0} \subseteq \Gamma$. This implies $\forall z, z \in \mathbf{0} \Rightarrow z \in \Gamma$.

Hence $\forall z, z \in \mathbf{0} \Rightarrow 1z \in \Gamma$.

 \therefore By definition of " \multimap ", $1 \in \mathbf{0} \multimap \Gamma = \Gamma \ ? \top$

 $\frac{}{\vdash \mathbf{1}} (one)$ Oviously,

$$1 \in \{1\} \subseteq \{1\}^{\perp \perp} = \mathbf{1}$$

Proof of soundness III

$$\bullet \frac{\vdash \Gamma, A \vdash A^{\perp}, \Delta}{\vdash \Gamma, \Delta} (cut)$$

We have to show that if $1 \in \Gamma \$ $^{\mathfrak{P}} A$ and $1 \in A^{\perp} \$ $^{\mathfrak{P}} \Delta$ then $1 \in \Gamma \$ $^{\mathfrak{P}} \Delta$. In fact this is equivalent to

$$1 \in \Gamma^{\perp} \multimap A, 1 \in A \multimap \Delta$$
$$\Rightarrow 1 \in \Gamma^{\perp} \multimap \Delta$$

This is easily followed by

$$\Gamma^{\perp} \subseteq A, A \subseteq \Delta$$
$$\Rightarrow \Gamma^{\perp} \subseteq \Delta$$

Proof of soundness IV

 $\bullet \frac{\vdash \Gamma, A \vdash \Gamma, B}{\vdash \Gamma, A \& B}$ (with)

We have to show that if $1 \in \Gamma \ ^{\mathfrak{P}} A$ and $1 \in \Gamma \ ^{\mathfrak{P}} B$ then $1 \in \Gamma \ ^{\mathfrak{P}} (A \& B)$. Here we use distributivity of $^{\mathfrak{P}}$ over &:

$$(\Gamma \stackrel{\mathcal{H}}{\rightarrow} A) \& (\Gamma \stackrel{\mathcal{H}}{\rightarrow} B) = \Gamma \stackrel{\mathcal{H}}{\rightarrow} (A \& B)$$

By definition of & and hypothesis, left hand side contains 1, and so does right hand side.

$$(\Gamma \stackrel{\mathcal{Y}}{\sim} A) \oplus (\Gamma \stackrel{\mathcal{Y}}{\sim} B) \subseteq \Gamma \stackrel{\mathcal{Y}}{\sim} (A \oplus B)$$

Proof of soundness V

$$\bullet \frac{\vdash \Gamma}{\vdash \Gamma, \bot} (\mathit{false})$$

$$\Gamma ? ? \bot = 1 \multimap \Gamma$$

By definition, **1** is the smallest fact contains 1 i. e. **1** $\subseteq \Gamma$ so that $\forall e, e \in \mathbf{1} \Rightarrow e = 1e \in \Gamma$ hence $1 \in \mathbf{1} \multimap \Gamma$.

$$\bullet \frac{\vdash \Gamma, A \vdash \Delta, B}{\vdash \Gamma, A \otimes B, \Delta}$$
(times)

We have to show that if $1 \in \Gamma \ \ A$ and $1 \in \Delta \ \ B$ then $1 \in \Gamma \ \ \Delta \ \ (A \otimes B)$. Hypotheses can be transformed into

Proof of soundness VI

 $1\in\Gamma^{\perp}\multimap A$ and $1\in\Delta^{\perp}\multimap B$ respectively. Therefore, we have $\Gamma^{\perp}\subseteq A$ and $\Delta^{\perp}\subseteq B$

$$\Rightarrow \Gamma^{\perp}.\Delta^{\perp} \subseteq A.B$$

$$\Rightarrow (\Gamma^{\perp}.\Delta^{\perp})^{\perp \perp} \subseteq (A.B)^{\perp \perp}$$

$$\Rightarrow \Gamma^{\perp} \otimes \Delta^{\perp} \subseteq A \otimes B$$

$$\Rightarrow \Gamma^{\perp} \otimes \Delta^{\perp} \multimap A \otimes B \ni 1$$

$$\Rightarrow \Gamma ? \Delta ? (A \otimes B) \ni 1$$

$$\frac{\vdash \Gamma, A, B}{\vdash \Gamma, A \stackrel{?}{\gamma} B} (par)$$
This is tautology.

Future work

- Categorical semantics: symmetrical monoidal (closed) category
- Application to functional programming: Combinatorial linear logic, categorical and linear machine
- Game semantics
